

March Madness – Overall Github Structure

The Github structure for the March Madness project is very strong. The group used the cookie cutter template provided at the beginning of the semester, and it showed in a clean and easy-to-navigate repository.

One feature that we particularly appreciated is the README file, which lays out the organizational structure of the repository nicely. It describes each of the folders and subfolders, and everything is named intuitively. It was the first text we saw when logging into the repository, and it provides a solid introduction to the project.

Another positive aspect of this repository is the thoroughness in materials. Not only are all reports, code, and code outputs in their respective folders, but the group also submitted their pickle and data files. This allows the viewer to fully replicate the group's work, which is an important part of the project review process.

One small suggestion is to delete the folders that don't have any files contained. It creates a bit of clutter on the repository, and it drags the viewer's eyes to places where there is no content, such as .ipynb_checkpoints and references. This is a very minor suggestion (especially since the README file is so well put-together), but it could improve the organization slightly.

Another small suggestion is to clean up the MarchMadness folder. Upon inspection, it doesn't look like there are any relevant files in here, but it is hard to tell from an initial glance and the folder is ambiguously named. Renaming this folder or deleting it altogether would help with navigation.
